

Testing Result Report

Functional test cases:

Registration Functionality

Test case ID	Test case	Result	Status
TC_R_1	Validate that the system does not accept an incorrect e-mail	E-mail address is accepted and OTP is sent to non existing e-mail	Not passed
TC_R_2	Validate that the system does not accept already existing e-mail	E-mail address is not accepted, systems dispalys error text "Pārbaudiet e-pasta adresi un mēģiniet vēlreiz. Ja jums jau ir kots, ienāciet."	Passed
TC_R_3	Validate that system is accepting correct OTP	OTP is confirmed. Website navigates to the personal information page	Passed
TC_R_4	Validate that system is not accepting incorrect OTP	Input field indicates red and error message "Nepareizs apstiprinājuma kods" is displayed	Passed
TC_R_5	Validate that system is not accepting outdated OTP	Input field indicates red and error message "Nepareizs apstiprinājuma kods" is displayed	Passed
TC_R_6	Check whether the first name and last name fields accept names containing long vowels and diacritical marks	Error message "Vārds un uzvārds var saturēt tikai burtus" appears	Not Passed

TC_R_7	Validate that the system does not accept an incorrect phone number - 9 symbols	Error message "Tālruņa numurs ir par garu" appears	Passed
TC_R_8	Validate that the system does not accept an incorrect password	Error message appears that password is not valid	Passed
TC_R_9	Verify whether it is possible to register by entering correct data in all fields	Registration is completed, the website navigates to the homepage, and the user is logged in	Passed
TC_R_10	Ensure that the apartment number input field restricts the use of letters	Registration is completed, the website navigates to the homepage, and the user is logged in	Not passed
TC_R_11	Ensure that the apartment number field has a limited input length	Registration is completed, the website navigates to the homepage, and the user is logged in	Not passed

The registration functionality works well, and with correct input the user can successfully log in to the system.

However, there are a few minor aspects that should be improved:

- the e-mail address verification used for sending the confirmation code does not properly validate the entered data (for example, when top-level domain symbols are missing)
- localization has not been fully considered, because Latvian diacritical marks cannot be used in the name and surname fields
- the apartment number field can contain letters and full words, and it has no input restrictions - this should be reviewed

Log-in functionality

Test case ID	Test case	Result	Status
TC_L_1	Validate that the user can successfully log in with correct data	The user is logged in and the website navigates to the main page.	Passed
TC_L_2	Validate that the system does not accept an incorrect e-mail format — multiple “@”	The e-mail address is not accepted by the system, and an error message is displayed in English: “A part following ‘@’ should not contain the symbol ‘@’.”	Passed
TC_L_3	Verify that authentication fails when the e-mail address contains a leading space	E-mail address is not accepted by the system and error message is displayed	Passed
TC_L_4	Verify that authentication fails when the e-mail address contains a trailing space	E-mail address is not accepted by the system and error message is displayed	Passed
TC_L_5	Validate that the system does not accept an incorrect password	The system does not accept the incorrect password and displays an error message	Passed
TC_L_6	Validate that the system does not accept the correct password when it is entered in a different case	The system does not accept the incorrect password and displays an error message	Passed

From a functional perspective, the login functionality works well. No bugs were found.

Cart functionality

Test case ID	Test case	Result	Status
TC_C_1	Validate that the 'Pievienot' button in the single product view adds the product to the shopping cart	The product is added to the cart displayed on the right side of the webpage	Passed
TC_C_2	Validate that the 'Pievienot' button in the catalogue view adds the product to the shopping cart	One product 'Piens LIMBAŽU PIENS 2,5% 1L' appears in the cart on the right side of the webpage	Passed
TC_C_3	Validate that a higher quantity of the product can be added to the cart from the product single view page	Quantity of the product in the shopping cart increases to 5	Passed
TC_C_4	Verify that the product quantity can be increased by manually entering a new value in the shopping cart	Quantity of the product in the shopping cart increases to 5	Passed
TC_C_5	Verify that decreasing the product quantity to 0 removes the product from the cart	Product is removed from the cart	Passed
TC_C_6	Verify that the user can't enter a quantity higher than the product's maximum threshold	The system does not accept value 15. The quantity automatically changes back to the maximum allowed value (8 pcs).	Passed
TC_C_7	Verify that the user can't enter special symbols into the product's quantity field in the shopping cart.	The special symbol is not added to the input field, and the original value remains.	Passed
TC_C_8	Verify that the user can't enter letters into the	The special symbol is not added to the input	Passed

	product's quantity field in the shopping cart.	field, and the original value remains.	
TC_C_9	Ensure cart items remain saved after user logs out and logs back in.	Product 'Limbažu piens 2,5% 1L' remains in the shopping cart	Passed
TC_C_10	Verify that products added to the shopping cart do not disappear when the website language is switched.	Product 'Limbažu piens 2,5% 1L' remains in the shopping cart	Passed

The shopping cart functionality works well. Users can add products from the single product view or from the product catalogue view. Items can be removed individually from the cart or the entire cart can be cleared. The product quantity can be increased or decreased using the '+' and '-' buttons, and it is also possible to enter the desired quantity manually. In the desktop view, the shopping cart is displayed on the right side of the page, which is very convenient because the cart and its contents are visible from any page on the website.

Non-functional tests:

Registration functionality

Test case ID	Test case	Result	Status
TC_R_12	Verify that the registration page loads in under 3 seconds	Page loads within 3 seconds	Passed
TC_R_13	Verify that submitting registration process steps under 3G shows loading indicator and completes successfully	The loading indicator appears every time the load speed is longer than 1 second	Passed

Registration form opens in under 2 seconds if the user has a stable internet connection. Users with slower internet speeds can still complete the registration successfully. The page loading speed is lower, but if any page takes more than one second to load, the system displays a loading indicator, which helps the user understand that the page is loading and not frozen.

Log-in functionality

Test case ID	Test case	Result	Status
TC_L_7	Verify that the message about the incorrect e-mail format is in Latvian	The e-mail address is not accepted by the system, and an error message is displayed in English: "A part following '@' should not contain the symbol '@'."	Not passed
TC_L_8	Verify that the login process completes within the normal time frame after the input data is submitted (< 2 seconds)	Load speed exceeds 2 seconds (2.73 s)	Not passed
TC_L_9	Verify that when the page loads slowly, a	Loading indicator appears	Passed

	spinner/loading indicator is shown		
TC_L_10	Validate that systems locks account after multiple failed attempts	The system does not accept the incorrect password and displays an error message every time the user tries to log in. However, after 10 attempts the account is not locked	Not passed
TC_L_11	Validate that after the log-in page opens, the cursor is active in the first input field for the e-mail address	The cursor is not active in the e-mail address input field	Not passed
TC_L_12	Verify that the system highlights fields with incorrect data or displays error messages before all information is submitted	The input fields is not highlighted as incorrect when data is added and no error message is displayed	Not passed

From a non-functional perspective, the login flow lacks Latvian localization of error messages, which has a direct impact on the user experience. The load speed after the e-mail and password are submitted exceeds 2 seconds, and this aspect should be improved. From a security perspective, the system should lock the session after at least 5–6 unsuccessful login attempts or display a CAPTCHA to increase security.

When entering the login page, the cursor is not active in the first input field. If the user cannot see where they are typing, this becomes a usability issue. There is also an issue when an incorrect data format is entered into the input fields – no error message appears and the fields are not highlighted. This has a direct impact on the user experience and overall usability.

Cart functionality

Test case ID	Test case	Result	Status
TC_C_11	Verify that cart loads properly with 20 items	Load time is 2.02 seconds, all items visible	Passed
TC_C_12	Verify that cart is responsive in mobile view	Products and buttons are visible, but the totals are not shown	Not passed

The shopping cart can handle more than 20 products and the page load speed is not affected. The cart is conveniently located on the right side of the screen in the desktop view, allowing the customer to access it and see its contents on every page. However, when the webpage is switched to the mobile view, the cart is not visible on every page, although customers can access it by clicking the cart icon in the main navigation. In the mobile view, when the customer opens the cart page, the totals are not displayed. This limits the ability to make informed purchase decisions and negatively affects user experience and cart usability.

Suggestions for Log-in functionality

- When the login page is opened, the cursor should be active in the first input field so the user can start entering data
- If incorrect data containing an invalid format is entered into the login form fields, the system should display a message to the user before all the information is submitted. This would make the process clearer and faster for the user
- Increase security measures, by locking out account after multiple failed login attempts
- Download speed of the login page should be increased
- Missing localization of error message about invalid e-mail format should be fixed

Suggestions for Registration functionality

- The validation algorithm for the entered e-mail format needs to be improved
- The first name and last name fields should accept names containing long vowels and diacritical marks
- The system should restrict entering letters in the apartment number field and limit the length
